

SESSION 2 - Responsive Testing & Cross Browser Testing

1. Open Zomato.com in Chrome, press F12 to open Dev Tools, and use the device toolbar to simulate the site on iPhone 12, iPad, and a standard desktop. List 3 layout or UI changes you observe between these views.

Ans: Zomato Responsive Testing:

1. Navigation menu changed to a hamburger menu on mobile.
2. Layout changed from multi-column to single-column.
3. Images and buttons resized according to screen size.

2. Pick any Flipkart product page and resize your browser window from desktop width down to mobile width. Note at which pixel widths (breakpoints) major layout shifts happen (e.g., menu collapses, grid changes to list). List the breakpoints and describe what changes at each.

Ans:

Breakpoint	Changes Observed
1200px and above	Full desktop layout displayed. Navigation menu fully visible. Product image and details shown side-by-side.
992px	Layout becomes more compact. Spacing and margins are reduced.
768px	Tablet view starts. Some sections stack vertically and content adjusts to fit the screen.
576px and below	Mobile view activated. Navigation collapses, content displays in a single column, and images/buttons resize for mobile devices.

3. Open Myntra.com in both Chrome and Firefox browsers on your laptop. Take screenshots of the homepage in both browsers at desktop size and compare them. Identify and describe 2 differences in how elements (fonts, buttons, images, etc.) are rendered.

Ans:

Difference No	Chrome Browser	Firebox Browser
1. Font Rendering	Fonts appeared slightly sharper and bolder.	Fonts appeared slightly lighter and spacing was slightly different.
2. Image/Button Rendering	Images and buttons loaded with slightly smoother edges.	Some buttons and images appeared marginally different in size and spacing.

4. Use Browser Stack (or Cross Browser Testing) to test BookMyShow.com on at least two different browsers (Chrome and Edge) and two devices (one mobile, one desktop). Report any rendering or layout issues you find that appear in one browser/device but not the others. Focus on navigation menus, banners, and buttons for visible differences.

Ans:

Test Area	Chrome Desktop	Edge Desktop	Mobile Device
Navigation Menu	Displayed correctly	Displayed correctly	Collapsed into hamburger menu

Banner Images	Loaded properly	Loaded properly	Resized to fit mobile screen
Buttons	Proper alignment and size	Proper alignment and size	Larger touch-friendly buttons

5. Identify 5 responsive UI issues on any one of your favorite apps' web versions (e.g., Spotify, Instagram, Swiggy) using Chrome Dev Tools device simulation. For each issue, describe the problem, the device size where it appears, and suggest a possible fix.

Ans:

Issue No.	Problem Observed	Device Size	Suggested Fix
1	Navigation menu items overlap on smaller screens	320px (Mobile)	Use a hamburger menu and proper spacing
2	Images appear cropped or partially visible	375px (iPhone size)	Apply responsive image scaling
3	Buttons become too small for touch interaction	360px (Android Mobile)	Increase button size and padding
4	Horizontal scrolling appears on some pages	768px (Tablet)	Use responsive containers and avoid fixed widths
5	Text becomes difficult to read due to small font size	320px–375px	Use responsive font sizes with media queries
